

WELCOME TO THE ACIT HUB WEBINAR SERIES

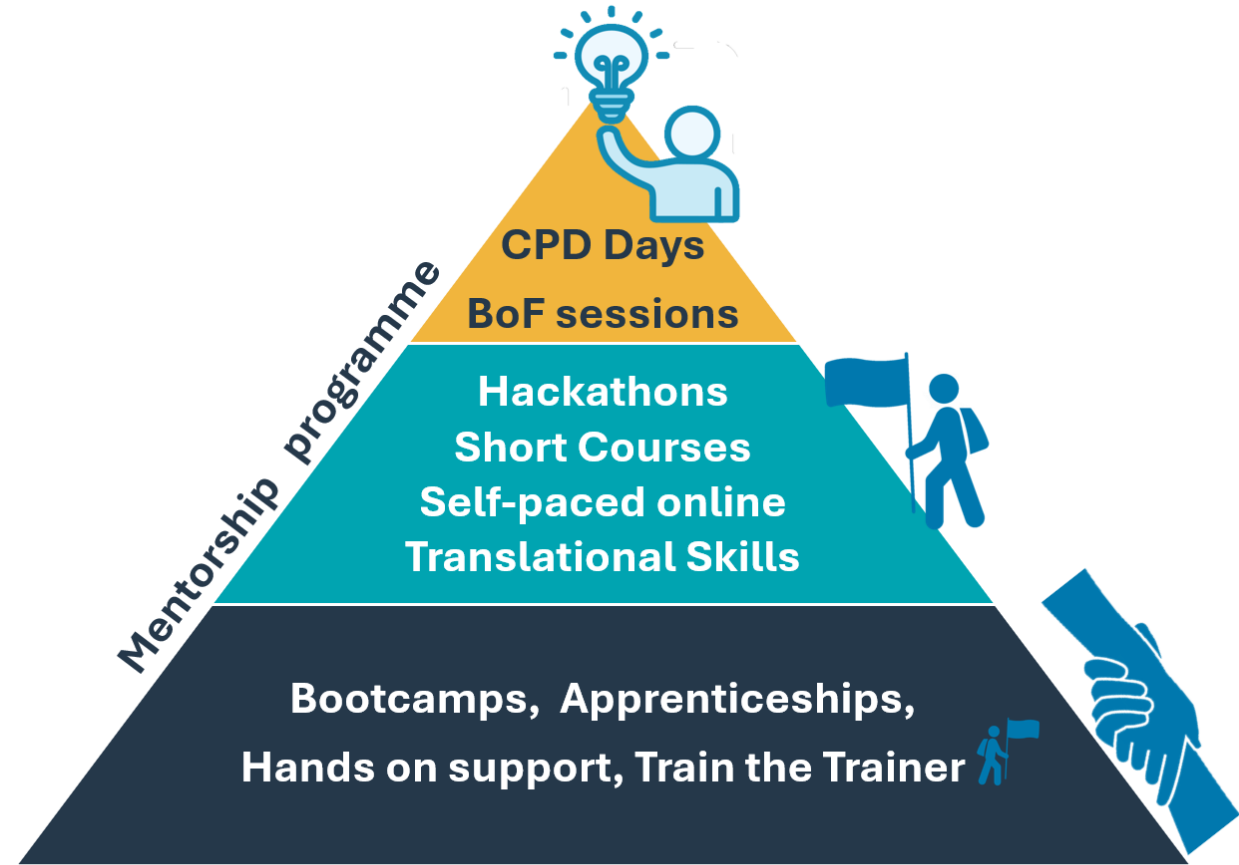

UK Research
and Innovation

Engineering and
Physical Sciences
Research Council

What is ACIT Hub?

- UKRI DRI Training Hub for RTP's
 - Research Technology Professionals
 - £3.9m total
- Aims – Focus on RIE's
 - Train & Share best practice
 - Raise profile
 - Improve career paths
 - Foster engagement with DRI funded initiatives (Tier 0/1/2 HPC)

Upcoming training & events

HPC Days 2026 Durham 15th-19th June

- RIE's & RSE working together towards user friendly, sustainable HPC
- Demystifying the Scheduler

Next webinar: July

Next hackathon: September

Agile in Research Computing Workshop

- RIE-focused Agile training course later in October
- In collab with a DisCouRSE-funded project

Co-design days

Housekeeping

- All microphones will be muted during the webinar
- Please ask questions via the Q&A box (not the chat box)
- Use the 👍 if there's a question you would like to see answered
- Code of conduct - <https://acit.surrey.ac.uk/events/codeofconduct.html>
- EDI survey
- Feedback for today's webinar

Today's speaker

Dr. Jaydeep Mody, Team Lead - Research Computing Sys Admin and ACIT-Hub Co-Lead, IT Services, University of Surrey

With a PhD in Computational Physics, Jaydeep started as an RTP in 2013. He is currently a Team Lead of the Sys Admin team within Research Computing Services at the University of Surrey. His activities include a mix of line/project management, coaching/mentoring, and providing software and systems support for Linux-based HPC and Research IT Platforms.

Becoming Agile in Research Computing – A Learning Journey

Dr Jaydeep Mody

Team Lead – Research Computing Sys Admin

University of Surrey, IT Services

(20th May 2026)

Welcome and Important Information

- Session will aim to focus on "lessons learnt" in Agile Journey
- Feel free to engage
 - Audience poll questions with options
 - Ask questions using Q & A section
 - Don't be shy with emojis - 👍 😂 ❤️
- No certified Agile professionals were involved – content is based purely on an ongoing "Learning Journey" through trial/error, plenty of reading/research, and shared experience/feedback from colleagues

Audience poll...

Typical Research-IT Services

Research Data Backup Data Security & Access Control Training & Workshops
Long-term Data Archiving Data Management Planning Consultancy & Advice
Research Software Engineering Code Development Support
GPU Computing **High Performance Computing (HPC)**
Technical Support
Storage Quotas & Resource Management **Research Data Storage** Collaborative Tools & Platforms
Virtual Research Environments **Research Data Management** Secure File Transfer
Data Visualization **Data Analysis Support** Remote Access to Resources
Containerisation & Virtualisation **Software & Tools Support** APIs & Integrations
Digital Research Support Research Workflows Researcher Identity & Access Management
Open Research Support Reproducible Research Support Project Support & Partnerships

The problems?

- Unaware of much Agile or need for any structured framework for workflow management - work processed in an ad-hoc manner – not all the time, but on many occasions prioritised based on who shouts loudest, emergencies, artificial priorities, mood, interests, etc.
- Work arriving through tickets, individual inboxes, meetings, corridor chats, etc. – leading to “unpleasant” phrases heard more frequently than normal.
 - ***“Sorry, I could not get “X” done as I have way too much on my plate, and I am feeling quite stressed...”***
 - ***“Oh yes, we discussed (promised) “X” in the meeting we had 3 months ago...remember?!”***
 - ***“He/She had emailed me a month ago about “X”...sorry...it’s due in 2 days!”***
 - ***(Typically by Managers) “Oh! Thought you were working on that already for the past X days/weeks?”***

Lesson 1 – Buy-in and Mindset

- 2 important prerequisites for implementing a functional structured workflow process like Agile
- Not going too far if you do not have buy-in from upper management. “At the very least” – this is needed from your immediate line manager
- Tried some form of “structured working” prior, but for us, this “buy-in” opportunity truly arose and solidified when covid hit in 2020 and team switched to remote-working
- And if you thought “buy-in” was the toughest part...you would be wrong
- Next task was to help team evolve and make a “mindset shift” – a continuous process

Lesson 2 – Centralising work capture

- Agile boards help with this – often called a “Backlog”.
- Started using a “Backlog”, however some work was still coming through multiple channels
- Had to make continuous effort to capture **everything** (however small or big) in **one-place**
 - This central capture cannot be underestimated – serves as the foundation to next steps
(Needs to be backed up by regular review!)
- Great – we have a way to do this! 2 popular frameworks – Scrum and Kanban.

Lesson 3 – Choosing appropriate Agile approach!

Scrum

Kanban

Origin

Software Development

Lean Manufacturing

Core Idea

Work is planned and delivered in **fixed-length iterations** called sprints (typically 1–4 weeks), i.e. work is "time-boxed"

Workflow is a **continuous** through the system with no fixed iterations/sprints

Approach

Team **commits to a set** of work items at the start of each sprint. (**Push-based** system)

Work is pulled as capacity becomes available and is **flexible**. (**Pull-based** system)

Roles

Product owner, Scrum master, Development team

No strict roles

Best Suited For

Product development with **structured planning** and regular review cycles

Continuous delivery, support/operational environments with **rapidly changing** priorities

Mindset

Plan a batch of incremental work and complete it within the **sprint**

Limit work in progress and optimise **flow** through the system

Lesson 3 – Choosing appropriate Agile approach!

Scrum

Pending Tasks

Kanban

Lesson 3 – Choosing appropriate Agile approach!

Completed Tasks

Kanban

Lesson 3 – Choosing appropriate Agile approach!

Scrum

Completed Tasks

Kanban

Lesson 3 – Choosing appropriate Agile approach!

- Scrum’s potential drawback for RIE (Research Infrastructure Engineering) environments
 - Typically, fixed tasks over a fixed period (1-4 weeks; usually 2 weeks). Avoid other distractions
 - Experimented for very short period (as a quick test) but soon found out its rigidity is not allowing for flexibility, which Kanban clearly offers, so made switch back to Kanban
- Came to conclusion
 - **Scrum** – typically for “development” teams with more planned tasks and structure (eg. RSEs)
 - **Kanban** – typically for “operational” teams with a more dynamic approach and flexibility (eg. RIEs)

Another key Kanban benefit – no “overheads” for initial setup – visualise your current real-time snapshot and iterate as you go!

Lesson 3 – Choosing appropriate Agile approach!

- Kanban – method to visualise workflow, using a “board” with columns
- Columns represent the various stages of work, starting with 3 basic columns, often many more columns.

To Do	Doing	Done
<p>Task J CoS standard #10 <input type="radio"/> To do</p>	<p>Task K CoS expedite #11 <input checked="" type="radio"/> In progress</p>	<p>Task A CoS standard #1 <input checked="" type="radio"/> Done</p>
<p>Task M CoS standard #13 <input type="radio"/> To do</p>	<p>Task I CoS fixed-date #9 <input checked="" type="radio"/> In progress</p>	<p>Task D CoS expedite #5 <input checked="" type="radio"/> Done</p>
<p>Task N CoS standard #14 <input type="radio"/> To do</p>	<p>Task F CoS standard #6 <input checked="" type="radio"/> In progress</p>	<p>Task B CoS fixed-date #3 <input checked="" type="radio"/> Done</p>
<p>Task O CoS standard #15 <input type="radio"/> To do</p>	<p>Task G CoS standard #7 <input checked="" type="radio"/> In progress</p>	<p>Task E CoS standard #2 <input checked="" type="radio"/> Done</p>
<p>Task P CoS standard #16 <input type="radio"/> To do</p>	<p>Task H CoS standard #8 <input checked="" type="radio"/> In progress 30 Jun</p>	
<p>Task Q CoS standard #17 <input type="radio"/> To do</p>	<p>Task L CoS intangible #12 <input checked="" type="radio"/> In progress</p>	
<p>Task S CoS standard #19 <input type="radio"/> To do</p>		
<p>Task R CoS intangible #18 <input type="radio"/> To do</p>		

Lesson 4 – A need for Prioritisation

- Through consistent capturing of “work-items” – overtime, the backlog grew and overwhelmed the boards!
- We had a list of captured work-items, but struggled with which should be picked? Decision paralysis – often picking inappropriately
- To pick based on what?
 - Which user "shouts" loudest?
 - What you "feel like" or "enjoy" the most?
 - Management wants it done?
 - Are there any serious hidden budget/programme deadlines upcoming? How would you know?
 - Oldest task? (Age is good but not always practical – plus how do you know age if not tracked?)
 - Some of this would happen in reality sometimes but "should be the exception, not the rule"
- If not above, can we have some clarity/rules for picking? Felt like we were missing something obvious
 - Researched **prioritisation methods/frameworks**

Lesson 4 – A need for Prioritisation

- Kanban **“Classes of Service” (CoS)** – this truly felt like a breakthrough for our situation!
- CoS help categorize different types of work based on nature, priority, delivery times, etc.
- Each CoS represents a specific set of rules/expectations regarding how work items should be treated and processed
- Every work-item assigned to 1 of 4 CoS

1.

Expedite

2.

Fixed-Date

3.

Standard

4.

Intangible

But what criteria to use to assign work-items to these classes...?

Lesson 4 – A need for Prioritisation

Many popular prioritisation frameworks, some included below...

RICE
(Reach, Impact,
Confidence, Effort)

MoSCoW
(Must have, Should have,
Could have, Won't have)

Kano Model
(Basic, Performance,
Excitement)

**Value vs Effort
Matrix**

**Cost of Delay
(CoD)**

WSJF
(Weighted Shortest
Job First)

Eisenhower Matrix
(Urgent vs Important)

9-Grid Matrix
(Impact vs Feasibility)

SAFe WSJF
(Scaled Agile Framework
– Weighted Shortest Job First)

**Benefits
Realisation
Prioritisation**

**Goal-Weighted
Scoring**

PIE Framework
(Potential, Importance,
Ease of Implementation)

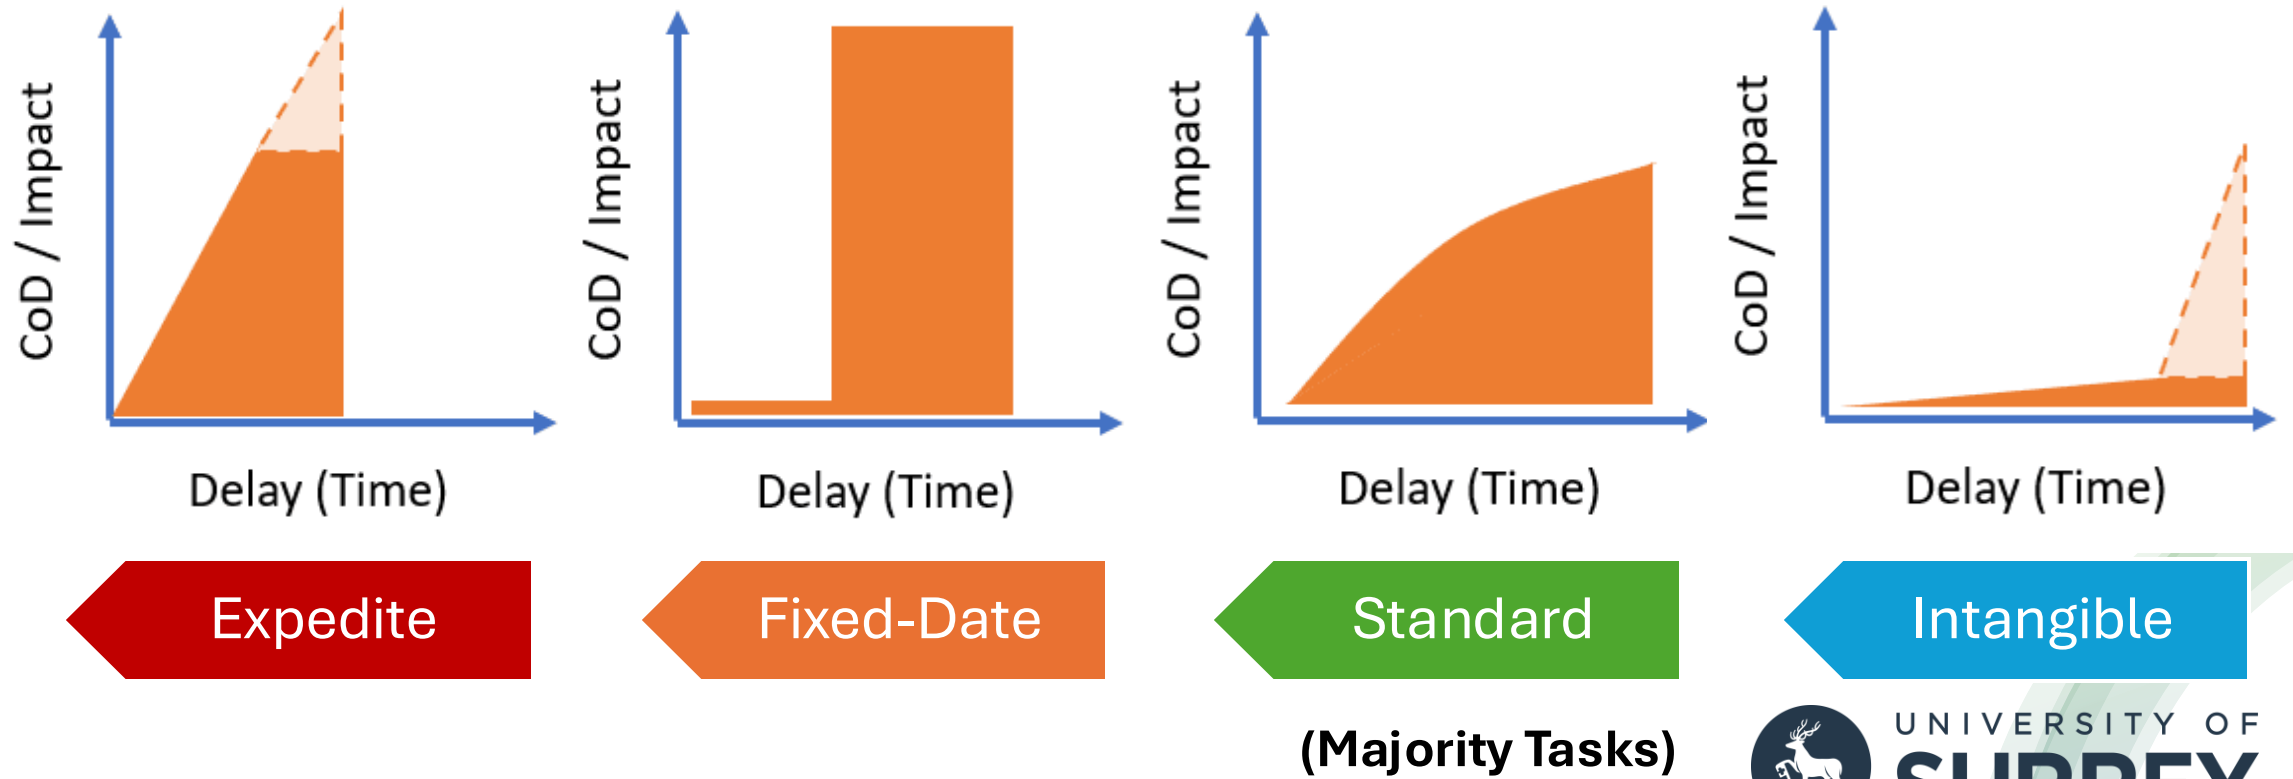

Lesson 4 – A need for Prioritisation

- The CoS (Classes of Service) technique uses the **Cost of Delay (CoD) prioritisation framework**
- To a team/organization – CoD is a principle that helps evaluate impact based on delaying a task, i.e. “Cost of Delay”

Lesson 4 – A need for Prioritisation

Relationship of the 4 x "Classes of Service" with "Cost of Delay"

Lesson 4 – A need for Prioritisation

- CoD (Cost of Delay) is ultimately a good way to manage “risk”
- “Cost” does not only mean financial
- Risks come in many forms, some examples include:
 - Financial
 - Cyber Security
 - Service Availability
 - Reputational
 - Customer Satisfaction

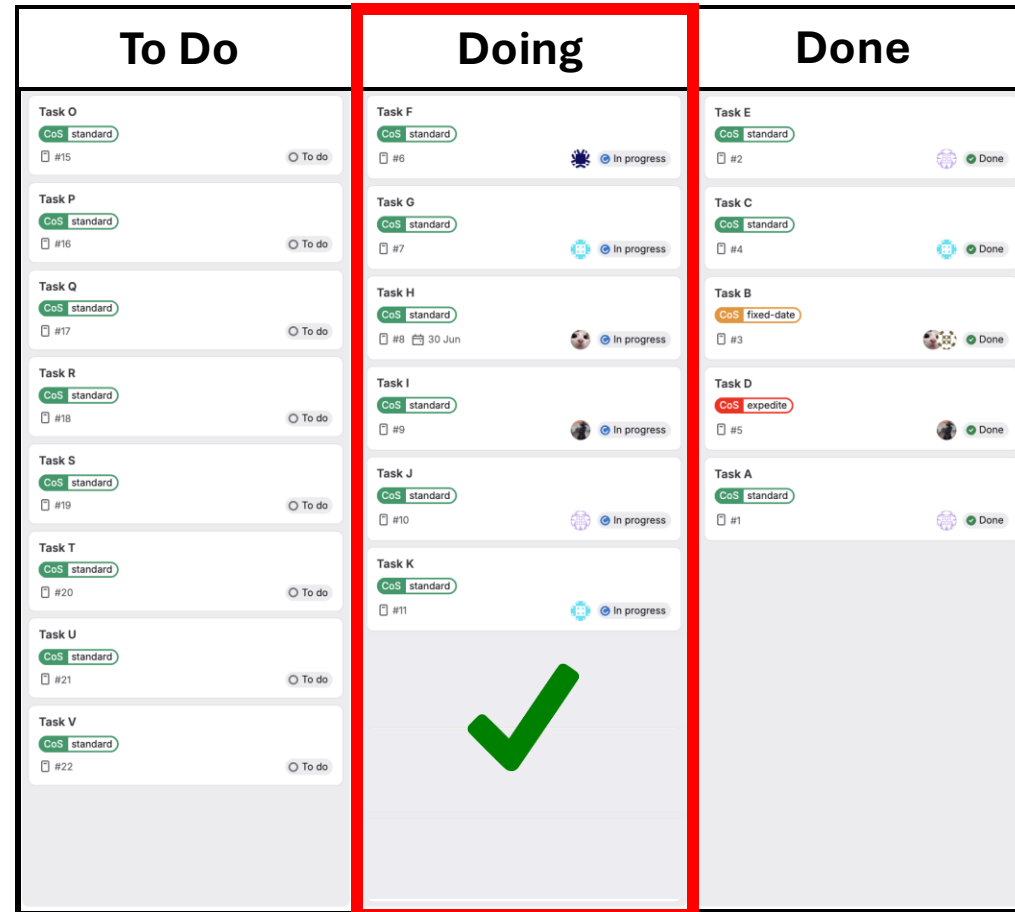

Lesson 5 – Limiting Work in Progress (“WIP”) - a silver bullet!

- One of the fundamentals about the Kanban process is to limit WIP (Work In Progress) so individuals are not overwhelmed / distracted
- Ensured no individual was working on > 3-5 work items at once
- However, if these are not “shared” work-items, but 5 separate work-items each, this increased the overall “Team WIP”
- Became a real bottleneck for us!

To Do	Doing	Done
Task O CoS standard #15 To do	Task F CoS standard #6 In progress	Task E CoS standard #2 Done
Task P CoS standard #16 To do	Task G CoS standard #7 In progress	Task C CoS standard #4 Done
Task Q CoS standard #17 To do	Task H CoS standard #8 30 Jun In progress	Task B CoS fixed-date #3 Done
Task R CoS standard #18 To do	Task I CoS standard #9 In progress	Task D CoS expedite #5 Done
Task S CoS standard #19 To do	Task J CoS standard #10 In progress	Task A CoS standard #1 Done
Task T CoS standard #20 To do	Task K CoS standard #11 In progress	
Task U CoS standard #21 To do	Task L CoS standard #12 In progress	
Task V CoS standard #22 To do	Task M CoS standard #13 In progress	
	Task N CoS standard #14 In progress	

Lesson 5 – Limiting Work in Progress (“WIP”) - a silver bullet!

- Idea was to limit WIP at “team level”, not only for individuals. Started putting an arbitrary value - not working very well - i.e. not seeing great “**flow**” of work-items
- Experimented, researched and continuously fine-tuned. More success with limiting WIP in “Doing” column

Q1 - How does a team know how well they are doing, i.e. how to measure progress?)

- Kanban is a method of managing workflow – “flow” being operative
- Focus of Kanban is to improve “flow” of tasks across the stages/columns, usually more columns than 3
- Some key “Flow Metrics” are:
 - Lead time
 - Cycle time
 - Work-in-Progress
 - Throughput
 - Flow Efficiency
 - Work-Item Age
 - CFD (Cumulative Flow Diagram)
 - Burn-down chart

Q1 - How does a team know how well they are doing, i.e. how to measure progress?)

- If you were to pick a couple metrics to start with:
 - Cycle time – amount of time a work-item spends “**In Progress**”
 - Lead time – amount of time a work-item spends from “**Request or Commitment**” to “**Resolution**”
- Philosophy – This is not a “prescribed” period – you measure what this is for your team/context and keep improving

Q2 - What "WIP" (Work In Progress) limit to use?

To Do	Doing	Done
Task O CoS standard #15 To do	Task F CoS standard #6 In progress	Task E CoS standard #2 Done
Task P CoS standard #16 To do	Task G CoS standard #7 In progress	Task C CoS standard #4 Done
Task Q CoS standard #17 To do	Task H CoS standard #8 30 Jun In progress	Task B CoS fixed-date #3 Done
Task R CoS standard #18 To do	Task I CoS standard #9 In progress	Task D CoS expedite #5 Done
Task S CoS standard #19 To do	Task J CoS standard #10 In progress	Task A CoS standard #1 Done
Task T CoS standard #20 To do	Task K CoS standard #11 In progress	
Task U CoS standard #21 To do	Task L CoS standard #12 In progress	
Task V CoS standard #22 To do	Task M CoS standard #13 In progress	
	Task N CoS standard #14 In progress	

- Was a struggle at first
- Tried recommended WIP of $n+2$ (n = teamsize). This was not a bad call, but it depends
- Another suggestion mentions WIP limit is between $1n$ and $2n$
- For a team of 10, WIP limit could be 10-20
- Likely in the middle is our experience so far, however very dependent on working environment
- Set something resonable and track what works – better answer over time

Q3 - How would work typically be broken down?

A People-Centred Approach

- Design processes to work for human beings, not against! "**Psychological safety**" – very important. Work transparency can feel revealing to some at first, however becomes more normal with coaching/time/understanding
- After all – process exists to expose bottlenecks and improve team – embrace it and approach with a healthy/positive attitude
- Agile will not solve all problems – good training, collaboration, leadership, thinking, documentation, initiative, culture, etc., still relevant
- Team-work – cards can be assigned to individual or small group – focus should be on how fast "team" is!
- Implementation
 - Start simple and increment slowly (be patient)
 - Use problems/frustrations as "signals" for next iteration
 - Need time for members to align with new processes
 - Need time to test if changes have worked

People dictate the boards and not the other way round !
